Mrs. E. H. Cooney and family have left for a short visit to friends in Belgrade and Helena.

Mrs. Knox has gone to Chicago for her health.

Miss Nellie Moran returned last evening from the Geysers, where she has been teaching.

PRICE OF BREAD.

It Comes Down One-Half in New York City.

New York, Oct. 29.—The unprecedented slump in the price of wheat may bring woe to the farmer and speculator, but the situation is not as gloomy for the consumers of bread, because cheaper wheat is to be followed by cheaper bread. The New York bakers, following the commendable lead of their fellow tradesmen of Washington, have decided to reduce the price of bread to conform to the relative price of wheat. Ever since wheat began to tumble to the lowest price in the history of the trade, a reduction in the domestic tariff of bread has been looked for, but it was not until last week, when the bakers of Washington knocked off a cent from the price of ordinary bread, that the breadmakers in New York and other cities began to consider the matter seriously. The reduction in Washington has compelled the New York bakers to make a similar concession, although they will maintain former prices. The weight of loaves is to be increased to double the present weight. In Washington a five-cent loaf of bread is now sold for four cents, but the price of the loaf sold for that price will give place to a two-pound loaf at the same rate.

THE MURPHY GOLD PROCESS.

It Enables Mines Hereabouts Profitably to Be Worked.

The recent issue of the Mining and Scientific Press contains a long article on the Murphy gold process, prepared by its inventor, John G. Murphy. The process is owned by the inventor, his brother, Hon. James H. Murphy, member of the last legislature, Hon. W. A. Clark, and J. K. Clark. The article enters into a minute description of the process, which was explained less in detail in a recent issue of the Independent. The process is in use now at the Moulton, at Butte. Its great feature is that it enables the owners of mines to work them at a profit, whereas by the old methods the same mines would not pay. It is claimed by the Murphy process that from 30 to 35 per cent of the gold contained in any ore can be saved. It makes no difference whether the gold is contained in iron pyrites, copper pyrites, peacock copper or anything else, it will be collected and saved by this process.
